Based in the Garden Route, Western Cape REGISTRATION NO: 2009/189352/23

Preapplication DRAFT BASIC ASSESSMENT REPORT

In terms of the **National Environmental Management Act** (Act No. 107 of 1998, as amended) & 2014 Environmental Impact Regulations as amended for:

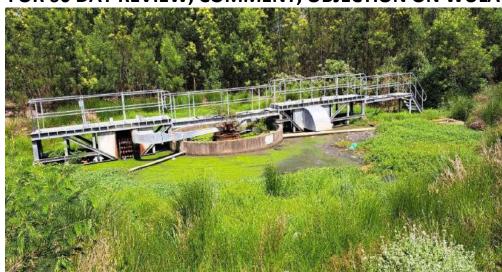

PREAPPLICATION DRAFT BASIC ASSESSMENT REPORT FOR THE UPGRADE OF A WASTE WATER TREATMENT WORKS AND INSTALLATION OF SMALL-BORE SEWAGE RETICULATION SYSTEM IN WOODLANDS KOUKAMMA LOCAL MUNICIPALITY, SARAH BAARTMAN DISTRICT MUNICIPALITY, EASTERN CAPE

DEDEAT REFERENCE: APPLICATION TO BE SUBMITTED AFTER INITIAL REVIEW OF PREAPPLICATION DRAFT BAR (THIS REPORT)

FOR 30-DAY REVIEW AND COMMENT: 4 SEPTEMBER – 6 OCTOBER 2025

ON PREAPPLICATION DBAR DWS REFERENCE: WU-42922

FOR 60 DAY REVIEW, COMMENT, OBJECTION ON WULA

PREPARED FOR THE APPLICANT: Koukamma local Municipality

Represented by Mr Mziwamadoda M. Qalaba

EMAIL: mzi.qalaba@koukamma.gov.za

PREPARED BY: CLAIRE DE JONGH (EAPASA REG: 2021/3519)

DATE: 4 September 2025

EXECUTIVE SUMMARY

1. INTRODUCTION

Woodlands Settlement is a rural settlement located in the Koukamma Local Municipality (KKLM) and situated on the R102 route in the Eastern Cape. The Woodlands Settlement is located approximately 15km southwest of Kareedouw Town.

The existing small-bore gravity sewer reticulation and digester system servicing Woodland's settlement is in urgent need of upgrade:

- The hydraulic and treatment capacity (ADWF) of the existing treatment plant is 250 kl/d
- The system was designed to take septic tank sludge; not domestic wastewater
- There is no Inlet works, thus no screening, degritting or flow measurement as legislated by DWS
- The system overflows in peak conditions;
- There is no inlet for "honey suckers"
- Limited capacity to clean the digesters has often led to unsanitary conditions.
- There is no chlorine contact tank
- There is no sludge management system
- As the system is not operational, effluent is not compliant with the limits of the general authorisation issued in terms of the National Water Act (Act 36 of 1998).

The Koukamma Local Municipality (LM) has commissioned SMEC South Africa for the design and implementation of the internal sewer reticulation, bulk sewer reticulation, and wastewater treatment works within the Woodlands Settlement.

2. LOCATION

The WWTW is located on Erf RE/1 (SG Code:C0340016000000100000) which is approximately 327 ha in extent.

- The expanded development footprint will be a total of approximately 2.2 ha in extent. Central coordinates: 34° 0'45.35"S; 24° 9'35.41"E)
- The proposed pipeline route alternatives will traverse Farm Palmiet River 2 / 584 (SG Code: C0340000000058400002)

3. PROJECT OVERVIEW

Decommissioning

 Discontinue current digester tank system; replace internal reticulation pipes with 160mm diameter class 34 uPVC pipes.

Reticulation

- The new system will operate as a gravity sewer, directing all pipes towards the settlements lower points.
- The alternative 1 Bulk Sewer Main runs adjacent to the boundary of the Woodlands Development. Future development will place dwelling units over the pipe route, which can potentially cause

unsanitary conditions if a pipe bursts, to mitigate, alternatives of Bulk Main sewer will be rerouted to run alongside the new developments and removed where they intersect future developments.

A 160mm diameter pipe, operating at 80% capacity, is sufficient for the development. To accommodate more than the anticipated 20% stormwater ingress, the pipe size will increase to a 200mm diameter class 34 uPVC pipe for the final 900 meters, connecting to the WWTW. Manholes should be placed every 80m, at pipe bends and all pipe connections.

Site layout and placement of bulk pipe line

The site layout has been revised to exclude infrastructure from sensitive aquatic areas as far as possible. Site layout 2 is deemed an acceptable layout option (Appendix A)

Design Capacity

The plant shall be designed for waterborne domestic sewage for the following flows:

```
ADWF – 500 kl/d,
PDWF – 800 kl/d,
PWWF – 1000 kl/d.
```

There is an additional requirement for receiving sewage from "honey suckers"

Future hydraulic load calculations (taking into account planned SDF housing in the area) provided by SMEC (Concept and Viability report – summary treatment options, May 2025 – Appendix C) are as follows:

```
ADWF – 462.37 kl/d,
PDWF – 869.45 kl/d,
PWWF – 1041.122 kl/d.
```

Head of Works

- The head of works will consist of:
 - A tanker dumping area
 - o 1x 10mm coarse mechanical screen
 - 2x degritting channels.

Sewage treatment process

Waste water treatment processes have been investigated, and the preferred treatment process is the Biological Nutrient Removal process consisting of anaerobic (no oxygen), anoxic (no oxygen, some nitrate), and aerobic (with oxygen) zones. Clarification will be applied (settling of activated sludge - Flux loading in summer can be expected to be 50 kg TS/m2/day and 65kg/m2/day in winter);

Effluent Treatment

Treated effluent will gravitate to 2x chlorine contact tanks. Effluent will then be discharged to a perennial stream south of the site and eventually reach the Groot Rivier.

Sludge Management

Sludge management options have been investigated and two sludge drying beds and dried sludge storage area is provided for in the design. Sludge is aimed to be treated to sludge classification a1A for beneficiation of surrounding community members and / or off-site disposal at registered waste site.

Stormwater Management

A stormwater dam whereby the excess flow overflows at the Inlet works and gravitates to a stormwater dam has been provided in the layout.

4. ENVIRONMENTAL SENSITIVITIES

A screening tool has been developed by the Department of Forestry, Fisheries and Environmental Affairs (DFFE). The Screening Tool identifies related exclusions and/ or specific requirements including specialist studies applicable to the proposed site and/or development, based on the national sector classification and the environmental sensitivity of the site. A screening report was generated for the proposed project; the sensitivities identified and verified are provided in Table 1.

Specialist Studies

The following specialist studies have been carried out:

- Geological and groundwater assessment (DHS Groundwater) (Appendix D1)
- Aquatic Assessment (Confluent Environmental Pty (Ltd)) (Appendix D2)
- Terrestrial Biodiversity Assessment and Flora Assessment (Jamie Pote) (Appendix D3)
- Fauna Assessment (Jonathan Colville and Callan Cohen) (Appendix D4)
- Agriculture desktop assessment (SoilzSa) (Appendix D5)
- Heritage, archaeology, paleontology screening assessment (CTS Heritage) (Appendix D6)

Table 1: Verification of environmental sensitivity identified in DFFE screening tool report; **Application Category:** Any activities within or close to a watercourse

Environmental | Verification of Theme and / or Description protocol sensitivity as environmental per screening sensitivity tool report Landscape/Visual NA NA WWTW is not located close to visual receptors with **Impact** exception of bulk line and internal reticulation. Assessment Visual impacts are assessed by the EAP - refer to section D. Agricultural The site is used as a WWTW site and size of area is High Low theme Sensitivity not conducive to large farming. Effluent and / or sludge can be beneficial to surrounding agricultural land users. A compliance statement has been prepared and states that there will be no loss of future agricultural production potential as a result of the development. The site is located in close proximity to the Woodlands residential development, the site is small (2.2 ha) and therefore prevents economies of scale, and there is no existing-agricultural infrastructure on the land. The agricultural potential is considered low.

| Theme and / or | Environmental | Verification of | Description |
|-----------------|-----------------|-----------------|--|
| protocol | sensitivity as | environmental | |
| | per screening | sensitivity | |
| | tool report | | |
| Animal Species | High | Low | Site is highly disturbed and not sensitive in terms of |
| | Sensitivity | | habitat provision due to current impacts. Some |
| | | | foraging may occur by raptors in the area, and |
| | | | rodents, amphibian and snakes and other reptiles |
| | | | likely occur due to the adjacent wet areas and |
| | | | landfill. |
| Aquatic | Very High | Very High | Site is within a strategic water source area, with a |
| Biodiversity | | | high aquifer potential, a fish FEPA and ECBCP aquatic |
| Hydrology | | | ESA1. The site needs to be correctly managed to |
| Assessment | | | prevent impacts associated with WWTW on |
| | | | sensitive aquatic and groundwater systems. The |
| | | | current treatment urgently requires an upgrade to |
| | | | address current pollution and health impacts. |
| Archaeological | Low sensitivity | Low | it is unlikely that the proposed development of the |
| and Cultural | | | WWTW will negatively impact on the cultural |
| Heritage | | | landscape value of the area |
| Paleontological | Very High | Low / Very | it is unlikely that the proposed development of the |
| | | high | WWTW will negatively impact on significant |
| | | | palaeontological and archaeological resources. |
| Plant Species | Medium | Low | Secondary vegetation and alien vegetation |
| Assessment | sensitivity | | dominates the site. No SCC present; species listed on |
| | | | PCNO are present and will require permits. |
| Terrestrial | Very High | Low | The development is not considered to have any |
| Biodiversity | Sensitivity | | significant impact on terrestrial biodiversity |
| Impact | | | sensitivity of the area. |
| Socio-Economic | NA | NA | Aspects related to socio-economic impacts will be |
| | | | addressed in the basic assessment, however no |
| | | | specific specialist study was deemed to be required. |
| Civil Aviation | Medium | | A civil aviation assessment / compliance statement |
| Assessment | sensitivity | | is excluded as the proposed development will not |
| | | | have an impact on civil aviation aerodrome. |
| Defence theme | Low sensitivity | | A defence them compliance statement is excluded |
| | | | as the proposed development will not have an |
| | | | impact on the defense theme. |

5. LEGAL REQUIREMENTS

National Water Act 36 of 1998

The Woodlands WWTW currently has a valid General Authorization in place dated 28 September 2017. The GA (Ref 27/2/2/K480/7/8) allows a volume of **1772.8 m3/annum** into the Groot River. (S21f)

An integrated Water Use License (WUL) for the proposed WWTW upgrade is required for the following water uses:

- Section 21(c) of the Act: Impeding or diverting the flow of water in a watercourse.
- Section 21(i) of the Act: Altering the bed, banks, course, or characteristics of a watercourse.
- Section 21(f) of the Act: Discharging waste or water containing waste into a water resource.

Note: Section 21 (g) of the Act: Disposing of waste in a manner which may detrimentally impact on a water resource - confirmed will not be triggered by DWS, preapplication meeting, May 2025

Note: Section 21 (e) of the Act: Reuse of effluent for irrigation – has not been included in the current WULA and will need to be applied for in the future should KKLM intend to reuse the treated effluent.

National Environmental Management Act (Act 107 of 1998)

The NEMA 2014 Environmental Imapet Assessment (EIA) Regulations (as amended, 2017) sets out a list of identified activities that may not commence without environmental authorisation from the competent authority. The proposed upgrade and associated development will requiring environmental authorisation for activities listed in GNR 327 and GNR 324.

National Environmental Management: Waste Act (Act 59 of 2008)

A waste management license is not likely to be required for the upgraded WWTW system in terms of the Waste management activities, GN 921, 2013 (as amended) published in terms of the National Environmental Management: Waste Act (Act 59 of 2008) (NEMWA). No disposal of waste is planned to occur on site.

All sludge management guidelines2006 – 2009, apply to the sludge management on the woodlands WWTW site as a combination of management methods are currently being considered including:

- Reuse of sludge by farmers
- Reuse of sludge by brickmakers
- Further composting of sludge onsite
- Offsite disposal

Treatment of organic waste using composting is being considered by the KKLM. Any composting facility and operation on site will require compliance to the Composting Norms and standards.

Existing practices (burying and covering of waste in hole) should have had a waste management license (and by default an environmental authorisation in place) however due to the urgency of the upgrade to address the existing significant environmental and health risks it is requested the proposed upgrade be authorised and the existing pollution be addressed as a part of this planned upgrade.

It is important to note that any WWTW treating only domestic waste has the potential to generate two very valuable agricultural input resources (treated effluent and sludge), and this should be strongly considered by the KKLM in all future planning around the settlement.

National Heritage Resources Act (Act 25 of 1999)

As required in terms of the National Heritage Resources Act (Act 25 of 1999), a Notice of Intent to Develop (NID) has been submitted to the Eastern Cape Provincial Heritage Resources Authority (ECPHRA) supported by the screener report prepared by CTS heritage.

6. IMPACT ASSESSMENT SUMMARY

Water quality is currently poor as a result of the non-functioning treatment system; the contamination needs to be urgently addressed. The proposed upgrade and planned placement of facilities and treatment and operational facilities are considered, overall, to be beneficial for the local environment (natural and social). Long term impacts on surface water and groundwater must be prevented through effective planning and design, effective construction and placement of facilities, and effective operations of the plant. The current negative impacts are expected to be adequately addressed through the upgrade and with all recommendations and mitigation measures in place. Effective operational management and supporting facilities, electricity and operators is critical to ensure this proposed treatment process is operationally sound. The significance of the majority of impacts with mitigations in place are rated as low / negligible; the exception is income generation which is considered to be a positive impact; reuse of all sludge is considered positive, an AIS management plan implemented in operations can have a positive impact. Of the feasible and reasonable site layout alternatives, site layout 3 (Appendix A) is deemed an acceptable layout option which includes: bulk pipeline route 3, structures (including section of access road) removed from delineated wetland area, inclusive of a sludge storage area.

Table 2: Summary of impacts associated with planning and design Phase and subsequent construction and operation

7. SUMMARY OF PUBLIC PARTICIPATION

The following public participation activities have been carried out:

- Initial IAP register applicant, landowner, adjacent landowners, organs of state, identified stakeholders and any NGOs
- The notice of intention to submit a Water use license application and environmental authorisation application and call for registration of interested and affected parties was distributed as follows:
 - Placing two posters close to the site to inform the public of the process, dated 27 March
 2025
 - Emailing notice and BID to organs of state, landowners, adjacent landowners and potential IAPs on 27 March 2025
 - Placing an advertisement in the KOUGA EXPRESS on 27 March 2025
- Registration period: 27 March to 2 May 2025 (NEMA and WUL) (30 days registration and initial comments)
- Update IAP register with additional registrations / identified parties (e.g. WUL officials, interested farmers, local brick making facilities)

The following public participation will take place:

- Advert, site notice and notices including the following:
 - The pre-application draft basic assessment report (this report) will be distributed to all registered interested and affected parties for a 30-day review and comment period to registered interested and affected parties prior to submission of the NEMA EA application to the competent authority.
 - The relevant water use license information (this report and appendix G)will be made available for a 60-day comment and objection periods (Note: The pre-application meeting with DWS has taken place and the online ewula process has commenced; Reference: WU-42922).
 - Link to reports will be provided in notices and adverts.
- The pre-application DBAR and accompanying PP and CRR (this report) will be updated accordingly
- The NEMA EA application will be submitted to the competent authority
- Upon receipt of the reference number the draft report will be distributed for a further 30-day review and comments period
- The post-application report and accompanying PP and CRR (this report) will be updated accordingly
- The final report submitted to the competent authority for consideration within 90 days of submission of the application (BAR process).

- The NEMA decision-making time frame is 107 days. Once a decision is reached the decision will be distributed to all registered interested and affected parties and provided with a 20-day timeframe to submit an appeal against the decision.
- Once all information has been accepted by the DWS, the decision-making process on the WULA is 90 days.

8. CONCLUSION

The pre-application draft basic assessment report (this report) will be distributed to all registered interested and affected parties for a 30-day review and comment period. The relevant water use license information (this report and appendix G) will be made available for a 60-day comment and objection periods Participation is encouraged by all registered interested and affected parties. Once the NEMA 30-day review and comment period has ended, the report will be updated accordingly and the NEMA application for EA submitted.
